

Employee Attrition Analysis

Internship Project Summary

Project Overview

As part of this internship project, I analyzed employee attrition data to understand the factors that are commonly associated with employees leaving the organization. The objective was to identify meaningful patterns in employee behavior and provide practical recommendations that could help the HR team improve retention and reduce employee turnover.

Key Findings

The analysis revealed that overtime was one of the strongest factors associated with employee attrition. Employees who worked overtime regularly were more likely to leave the company compared to those who maintained a better work-life balance.

Monthly income also showed a clear relationship with attrition. Employees who left the organization generally had lower salaries than employees who stayed. In addition, employees with fewer years of work experience were found to leave more frequently than experienced employees.

From a departmental perspective, the Sales department recorded the highest attrition rate. Among all job roles, Sales Representatives showed the highest employee turnover. The analysis also suggested that workplace environment and manager-related factors may influence an employee's decision to remain with the company.

Business Impact

Employee attrition can create challenges for both productivity and business growth. When employees leave, organizations must spend additional time and resources on recruitment, onboarding, and training. High attrition levels can also affect team performance and increase workload for existing employees.

Understanding the reasons behind employee turnover can help the organization take proactive steps to improve retention.

Recommendations for HR

Based on the findings, HR should pay closer attention to employees who frequently work overtime and take measures to promote a healthier work-life balance. Employees working in high-attrition roles, especially Sales Representatives, should be provided with regular support and career development opportunities.

The company should also review compensation structures and growth opportunities to ensure employees feel valued and motivated. Strengthening communication between managers and employees may further improve employee satisfaction and long-term retention.

Conclusion

This analysis helped identify several factors that are associated with employee attrition, including overtime, income level, work experience, and job role. The findings suggest that employee retention is influenced by a combination of workplace, financial, and career-related factors. By focusing on these areas, the organization can take informed steps toward improving employee satisfaction and reducing future attrition.
